

AC RESISTANCE OF RECTANGULAR COIL

S. C. Snowdon

January 20, 1968

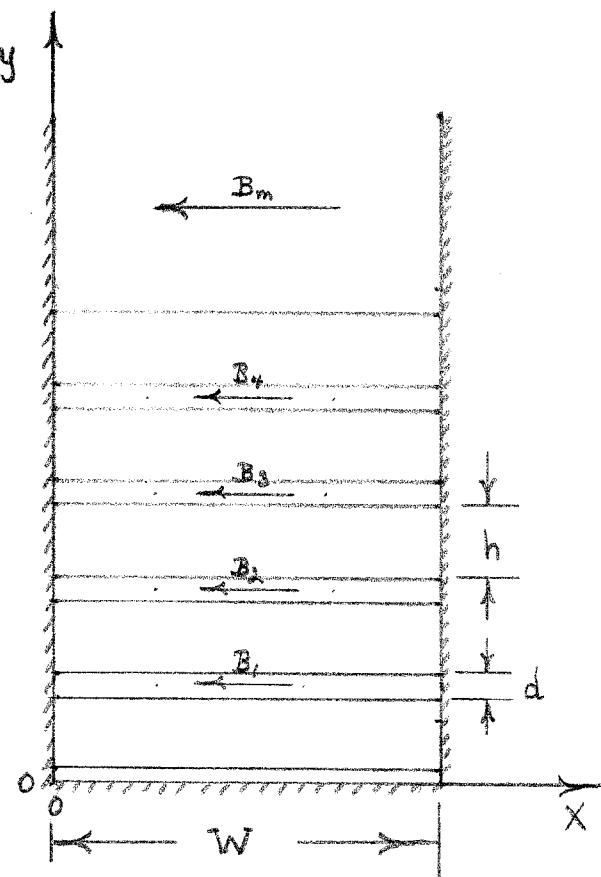

PURPOSE: To determine the AC resistance of rectangular conducting strip wound to form an excitation coil in a deep slot.

FORMULATION OF PROBLEM

The following figure shows the quantities of interest in the problem.

Within a conductor of thickness h one has

$$\nabla \times \vec{B} = 4\pi\mu \vec{J}, \quad \nabla \times \vec{E} = -\frac{\partial \vec{B}}{\partial t}, \quad \vec{J} = \sigma \vec{E} \quad (\text{emu}) \quad (1)$$

For uniform σ , unity permeability and harmonic time variation ($e^{j\omega t}$) one has

$$\nabla \times \nabla \times \vec{B} = -4\pi j \sigma \omega \vec{B}. \quad (2)$$

Let

$$\vec{B} = \vec{\mathcal{L}} U, \quad \vec{\mathcal{L}} = k_x \nabla. \quad (3)$$

Then from Ref. 2

$$\vec{\mathcal{L}}(\nabla^2 U - 4\pi j \sigma \omega U) = 0 \quad (4)$$

or

$$\nabla^2 U = 4\pi j \sigma \omega U. \quad (5)$$

For the operator chosen, since B does not depend on x , U is a function of y apart from the $e^{j\omega t}$ variation. Letting

$$\lambda^2 = 4\pi j \sigma \omega \quad (6)$$

one has

$$U = A \operatorname{Ch} \lambda y + B \operatorname{Sh} \lambda y \quad (7)$$

or

$$B_x = -\lambda (A \operatorname{Sh} \lambda y + B \operatorname{Ch} \lambda y).$$

The field is uniform in the gaps between conducting strips and above the coil. If there are m strips and a total current flowing of NI , then the increment in field from gap to gap between strips is

$$B_m - B_{m-1} = B_{m-1} - B_{m-2} = \cdots B_2 - B_1 = B_1 - 0 = \frac{4\pi NI}{m W} \quad (8)$$

Hence

$$B_n = \frac{4\pi NI}{m W} n, \quad 0 < n \leq m. \quad (9)$$

Thus within the n^{th} conductor

$$U_n(y) = \frac{4 \pi N I}{m W \lambda} \left\{ \frac{n-(n-1)}{Sh \lambda h} Ch \lambda h \right. \\ \left. + (n-1) Sh \lambda \left[y - \frac{2(n-1)}{2} (h+d) + \frac{h}{2} \right] \right\} \\ \text{for } \frac{2(n-1)}{2} (h+d) - \frac{h}{2} < y < \frac{2(n-1)}{2} (h+d) + \frac{h}{2} \quad n = 1, 2, 3, \dots m.$$
(10)

AVERAGE POWER (AC RESISTANCE)

For direct current excitation the power consumed per unit length of each conducting strip is

$$P_o = \frac{N^2 I^2}{\sigma m^2 W h} . \quad (11)$$

In the alternating current case, the average power in the n^{th} strip is

$$P_n = \frac{1}{2 \sigma} \int \vec{J} \cdot \vec{J}^* dV = \frac{1}{32 \pi^2 \sigma} \int \nabla^2 U \nabla^2 U^* dS$$

or, from Eq. (5)

$$P_n = \frac{\lambda^2 \lambda^*^2 W}{32 \pi^2 \sigma} \int_{\frac{2(n-1)}{2} (h+d) - \frac{h}{2}}^{\frac{2(n+1)}{2} (h+d) + \frac{h}{2}} U_n(y) U_n^*(y) dy . \quad (12)$$

Thus

$$\frac{P_n}{P_o} = 2 \pi \sigma \omega h \int_0^h [A_n Ch \lambda u + D_n Sh \lambda u] [A_n^* Ch \lambda^* u + D_n^* Sh \lambda^* u] du , \quad (13)$$

where

$$u = -\frac{2(n+1)}{2} (h+d) + \frac{h}{2} + y \quad (14)$$

$$A_n = \frac{n - (n-1) Ch \lambda h}{Sh \lambda h} \quad (15)$$

$$D_n = n - 1 . \quad (16)$$

Equations (15) and (16) give

$$A_n A_n^* = \frac{n^2 - 2n(n-1) \operatorname{Ch} \left[\frac{\lambda + \lambda^*}{2} h \right] \operatorname{Ch} \left[\frac{\lambda - \lambda^*}{2} h \right] + \frac{1}{2}(n-1)^2 \{ \operatorname{Ch} [(\lambda + \lambda^*) h] + \operatorname{Ch} [(\lambda - \lambda^*) h] \}}{\frac{1}{2} \{ \operatorname{Ch} [(\lambda + \lambda^*) h] - \operatorname{Ch} [(\lambda - \lambda^*) h] \}} \quad (17)$$

$$A_n D_n^* + A_n^* D_n = \frac{2n(n-1) \operatorname{Sh} \left[\frac{\lambda + \lambda^*}{2} h \right] \operatorname{Ch} \left[\frac{\lambda - \lambda^*}{2} h \right] - (n-1)^2 \operatorname{Sh} [(\lambda + \lambda^*) h]}{\frac{1}{2} \{ \operatorname{Ch} [(\lambda + \lambda^*) h] - \operatorname{Ch} [(\lambda - \lambda^*) h] \}} \quad (18)$$

$$(A_n D_n^* - A_n^* D_n) = \frac{-2n(n-1) \operatorname{Sh} \left[\frac{\lambda - \lambda^*}{2} h \right] \operatorname{Ch} \left[\frac{\lambda + \lambda^*}{2} h \right] + (n-1)^2 \operatorname{Sh} [(\lambda - \lambda^*) h]}{\frac{1}{2} \{ \operatorname{Ch} [(\lambda + \lambda^*) h] - \operatorname{Ch} [(\lambda - \lambda^*) h] \}} \quad (19)$$

$$D_n D_n^* = (n - 1)^2 . \quad (20)$$

Using

$$\lambda = (1 + j) p , \quad p = \sqrt{2 \pi \sigma \omega} , \quad (21)$$

Eqs. (17-20) become

$$A_n A_n^* = \frac{2n^2 - 4n(n-1) \operatorname{Ch} ph \cos ph + (n-1)^2 [\operatorname{Ch} 2ph + \cos 2ph]}{\operatorname{Ch} 2ph - \cos 2ph} , \quad (22)$$

$$A_n D_n^* + A_n^* D_n = \frac{4n(n-1) \operatorname{Sh} ph \cos ph - 2(n-1)^2 \operatorname{Sh} 2ph}{\operatorname{Ch} 2ph - \cos 2ph} , \quad (23)$$

$$j(A_n D_n^* - A_n^* D_n) = \frac{4n(n-1) \operatorname{Ch} ph \sin ph - 2(n-1)^2 \sin 2ph}{\operatorname{Ch} 2ph - \cos 2ph} \quad (24)$$

$$D_n D_n^* = (n - 1)^2 . \quad (25)$$

The resistance ratio (AC/DC) may be found from the power ratio.

Thus Eq. (13) gives after integrating

$$\begin{aligned} \frac{R_n}{R_o} &= \frac{ph}{2} \{ A_n A_n^* (\operatorname{Sh} 2ph + \sin 2ph) + (A_n D_n^* + A_n^* D_n) (\operatorname{Ch} 2ph - 1) \\ &\quad + j (A_n D_n^* - A_n^* D_n) (\cos 2ph - 1) + D_n D_n^* (\operatorname{Sh} 2ph - \sin 2ph) \} \end{aligned} \quad (26)$$

The average resistance ratio may be found by summing

$$\langle r \rangle = \frac{1}{m} \sum_{n=1}^m \frac{R_n}{R_o} . \quad (27)$$

In this case, the average coefficients may be found. Thus

$$\frac{1}{m} \sum A_n A_n^* = \frac{\frac{1}{3}(m+1)(2m+1) - \frac{4}{3}(m^2-1) \operatorname{Ch} ph \cos ph + \frac{1}{6}(m-1)(2m-1) (\operatorname{Ch} 2 ph + \cos 2 ph)}{\operatorname{Ch} 2 ph - \cos 2 ph} \quad (28)$$

$$\frac{1}{m} \sum (A_n D_n^* + A_n^* D_n) = \frac{\frac{4}{3}(m^2-1) \operatorname{Sh} ph \cos ph - \frac{1}{3}(m-1)(2m-1) \operatorname{Sh} 2 ph}{\operatorname{Ch} 2 ph - \cos 2 ph} \quad (29)$$

$$\frac{j}{m} \sum (A_n D_n^* - A_n^* D_n) = \frac{\frac{4}{3}(m^2-1) \sin ph \operatorname{Ch} ph - \frac{1}{3}(m-1)(2m-1) \sin 2 ph}{\operatorname{Ch} 2 ph - \cos 2 ph} \quad (30)$$

$$\frac{1}{m} \sum D_n D_n^* = \frac{1}{6} (m - 1) (2m - 1) . \quad (31)$$

CALCULATIONS

The ratio of AC resistance to DC resistance for each layer as given by Eq. (26) has been computed at 15 Hz for several thicknesses ranging from 0.125 inch to 1.000 inch. In addition, for each layer the average ratio as given by Eq. (27) for all layers up to and including the layer in question is recorded. These results are shown in Table I.

TABLE I. AC RESISTANCE RATIOS

Frequency			15 Hz		
Resistivity			$1.86 \mu\Omega \text{ - cm}$
